

Abstract:

Epilator

In an epilating device including a rotary cylinder (1) capable of being set in rotation about its axis (2), clamping means (7) for gripping and removing hairs are arranged about the circumference of the same in a manner offset in the circumferential direction, and the actuating means for the clamping means (7) are designed and arranged in a manner that at least two clamping means (7) offset in the circumferential direction are each actuated at the same time. (Fig. 1)
